

**Guidelines for Linking Addiction Treatment with Primary Healthcare
Developed for the Behavioral Health Recovery Management Project**

**Michael G. Boyle, MA
President and CEO
Fayette Companies
Peoria, IL**

**Thomas P. Murphy, D. Min.
Vice President
White Oaks Programs
Fayette Companies
Peoria, IL**

Funding for the development of this guideline was provided by the Illinois Department of Human Service's Department of Alcoholism and Substance Abuse.

Introduction

In the last two decades, the authors of this guideline have often heard primary care physicians refer to addiction treatment services as a “black hole”. When pressed for elaboration, they explain that when their patients are referred to alcoholism or addiction treatment, no information comes out of that system. They are not informed of patient progress, treatment completion or non-completion or recommendations for continuing care. This contrasts significantly with referrals to other specialists wherein the treatment is regularly communicated and a collaborative relationship is maintained.

Several explanations may exist for this disconnect with primary healthcare:

- The legacy of the historical battle for addiction treatment to be viewed as a separation from the “medical model of treatment”.
- An extreme application of the federal and state rules regarding confidentiality of alcoholism and addiction treatment. Primary care physicians are not included in the list of those who “need to know”.
- Perceived stigma – addiction treatment professionals internalization of stigma to the extent that they would perceive the individual wants to hide the disorder from their primary care physician.
- Lack of an orientation to “global health” on the part of addiction treatment professionals or organizations. “Our only responsibility is to treat alcoholism or substance abuse disorders”.

This criticism must be tempered by the fact that primary care physicians do not routinely provide any comprehensive screening for substance use disorders. The screening is commonly limited to a couple questions on the intake form regarding what alcohol or illicit drugs are used and the extent of use. These questions are unlikely to elicit detailed or accurate information for obvious reasons. As one person mentioned in a planning group: “I would never answer those questions accurately. But, if the doctor would have looked at my fingers, he would have seen the blisters and scars from my lighting the crake pipe”.

Many physicians have also confessed to us that they do not search for addiction or mental health disorders because they would not know how to address the problems if they were to be discovered. The doctors and primary health care providers lack the training to address behavioral health problems and the knowledge of how to link persons to needed treatment. Finding a behavioral health problem may result in potential liability to the physician. If a substance use or mental health disorder is diagnosed, the doctor becomes responsible for assuring the problem is addressed. The lack of knowledge on how to refer to specialists for treatment and the lack of a feedback loop incents the physician to not investigate for behavioral health disorders from a risk management standpoint.

Significant attention has been focused on co-occurring substance use and mental disorders in the last decade. The concept of co-occurring disorders must be expanded to include the address of other health problems common among those with addictions such as Hepatitis C or liver function problems.

Adoption of a Disease Management Approach

Substance use disorders are often treated as acute conditions, without putting continuing recovery management in place. Along with The American Society of Addiction Medicine, we affirm its *chronic nature* and recommend a disease management approach. Research shows that brief interventions by a medical provider are very effective in recovery engagement and relapse prevention. As with other chronic diseases, recovery from alcohol and other drug dependencies is marked by progress, exacerbation and is often complicated by co-morbidities. A support relationship between a primary health-care giver and a patient can be very helpful in the recovery process. The above assumptions prompt us to use the definition and components of disease management (as determined by The Disease Management Association of America) in formulating this protocol.

Disease Management is a system of coordinated healthcare interventions and communications for populations with conditions in which patient self-care efforts are significant. Disease management:

- supports the physician or practitioner/patient relationship and plan of care,
- emphasizes prevention of exacerbations and complications utilizing evidence-based practice guidelines and patient empowerment strategies, and
- evaluates clinical, humanistic, and economic outcomes on an going basis with the goal of improving overall health.

Disease Management Components include:

- Population identification processes
- Evidence-based practice guidelines
- Collaborative practice models to include physician and support-service providers
- Patient self-management education (may include primary prevention, behavior modification programs, and compliance/surveillance)
- Process and outcomes measurement, evaluation, and management
- Routine reporting/feedback loop (may include communication with patient, physician, health plan and ancillary providers, and practice profiling)

Behavioral Health Recovery Management

In addressing chronic conditions within behavioral health, the disease management model has been expanded and framed as Behavioral Health Recovery Management (BHRM). Several key additional components are included as outlined in the BHRM principles:

1. Recovery Focus: Full and partial recoveries from severe behavioral health disorders are living realities evidenced in the lives of hundreds of thousands of individuals in communities throughout the world. Where complete and sustained remission is not attainable, individuals can actively manage these conditions in ways that transcend the limitations of these disorders and allow a fulfilled and contributing life. The BHRM model emphasizes recovery processes over disease processes by affirming the hope of such full and partial recoveries and by emphasizing client strengths and resiliencies rather than client deficits. Recovery re-introduces the notion that any and all life goals are possible for people with severe behavioral health disorders.

2. Client empowerment: The client, rather than the professional, is at the center of the BHRM model. The goal is the assumption of responsibility by each client for the management of his or her long-term recovery process and the achievement of a self-determined and self-fulfilling life. Client empowerment involves not just self-direction of one's own recovery, but opportunities for involvement in the design, delivery and evaluation of services provided by behavioral health organizations and involvement in shaping public attitudes and public policies regarding behavioral health disorders.

3. The Destigmatization of Experience: The BHRM model seeks to "normalize" or otherwise respect a person's experiences with behavioral health disorders and subsequent services. In this way, the person escapes attacks on self-esteem and self-efficacy that often accompany the stigma of mental illness. Moreover, the public begins to endorse positive images of behavioral health that undermine the prejudice and discrimination that frequently accompanies services.

4. Evidence-based Interventions: The BHRM model emphasizes the application of "evidence-based" interventions at all stages of the disease stabilization and recovery process. The "evidence" undergirding such interventions includes scientific studies (randomized clinical trials, clinical field experiments) and inter-disciplinary professional consensus regarding promising approaches, but the ultimate evidence is the fit between the intervention and the client at a particular point in time as judged by the experience and response of the client.

5. Service Integration: Based on the recognition that severe disorders heighten vulnerability for other disorders and problems, the BHRM model seeks to coordinate categorically segregated services into an integrated response focused on the person rather than territorial ownership of the person's problems. The goal is to mesh these historically isolated services into an integrated, recovery-oriented system of care. The BHRM model advocates multi-agency, multi-disciplinary service models that can provide less fragmented and more holistic care.

6. Development of Clinical Algorithms: As knowledge and application of evidence based practices advance, the challenge becomes knowing what treatment approaches to use with specific individuals as they progress through the stages of change and stages of treatment. Medication algorithms have been developed that specify preferred first line prescriptions for specific diagnoses, dosing and time frames for evaluating the effects. Similar practice support algorithms are needed for clinicians utilizing psychosocial treatments.

7. Application of Technology: The rapid advances in technology must be applied to recovery from serious mental illness and addictions. Technology being utilized in other fields may be adopted or adapted to addressing behavioral health issues. While web based services and supports are currently being explored, what other technologies could be made available for treatment and recovery support? Is there an application for GPS, nanotechnology or other developing scientific advances? Many technologies could be applied today while we await the miracles that will arise from the human genome project through fields such as genetic engineering and bioinformatics.

8. Recovery Partnership: In the BHRM model, the traditional professional role of "expert" and "treater" progressively shifts to a recovery management partnership with the client. Within this partnership, the professional serves primarily as a "recovery consultant." The service relationship within the BHRM model is marked by continuity of contact in a primary service relationship (with a recovery consultant) over time--a relationship analogous to that between a physician and patient managing any health care problem characterized by chronicity and episodic acuity.

9. The Ecology of Recovery: The family (as defined by the client) and community constitute a reservoir of support for long-term recovery from behavioral health disorders. The BHRM model seeks to enhance the availability and the support capacities of family, intimate social networks and indigenous institutions (e.g., mutual aid groups, churches) to persons recovering from behavioral health disorders. The BHRM model also extends the locus of service delivery from the professional environment to the natural environment of the client. One of the major goals of the BHRM model is to create the physical, psychological and social space within which recoveries can flourish in local communities.

10. Monitoring and Support Emphasis: The BHRM model emphasizes the need for on-going monitoring, feedback and encouragement, linkage to indigenous supports and, when necessary re-engagement and early re-intervention. This model of sustained monitoring and recovery support services contrasts with models that provide repeated episodes characterized by "assess, admit, treat, and discharge," as is traditional in the treatment of substance use disorders. It also contrasts with mental health programs that focus on stabilization and maintenance of symptom suppression rather than on recovery and personal growth.

11. Continual Evaluation: Service and support interventions must be matched not only to the unique needs of each client but to the stage-specific needs of each client as these

needs evolve through the stages of recovery. In the BHRM model, both assessment and evaluation become continual activities rather than activities that mark the beginning and conclusion of a service episode. There is also a shift from evaluating single episodes of care to evaluating the effect of particular combinations and sequences of interventions on the course of behavioral health disorders and on recovery careers.

Linkage to Primary Health Care

A primary care physician can play a valuable role as a partner in assisting those served in addiction treatment to achieve positive outcomes while screening for and treating other health care disorders. Identified health care issues often require frequent visits to the primary health care provider. These can serve as an opportunity for the physician or nurse to inquire about continuing abstinence or return to use. If the person has reassumed use of alcohol or drugs, the primary care provider can use supportive “early re-intervention” to attempt to assist the individual to re-engage in addiction treatment. Note that the key word is “supportive” not confrontational. Abundant research exists that persons trust and listen to the advice of their physicians. For example, brief motivational sessions giving facts and information about a person's alcohol use with advice has found to significantly reduce patient drinking in many studies.

If the person is maintaining abstinence or has significantly reduced the days of use or amounts, the physician has an opportunity to reinforce this behavior and may be able to provide data on increased health status to further reinforce the new behaviors.

Example:

Joe, let me show you the results of your liver function profile we did last week compared to the test results two years ago. This shows a 20% positive increase in functioning. Your decision to stop drinking is really having a great impact on your health!

Most primary care physicians are comfortable in prescribing for less severe mental health problems such as depression and anxiety disorders. A high percentage of persons in addiction treatment also suffer from these co-occurring disorders. The linkage to a primary care physician can allow for ongoing prescribing and monitoring of needed psychotropic medications.

Thus, the primary care physician can play an important role in implementing the principles of Behavior Health Recovery Management.

Identification of existing primary care relationships

Upon assessment and intake, the existence of an ongoing primary care relationship is identified and the name and address of the physician obtained. The client is asked to send a letter to their physician indicating that they have sought help for a substance use disorder and requesting their ongoing support. A sample letter is included in Attachment A. The client is also asked to sign a consent that will allow the addiction treatment program to send a letter to their physician providing information on addictions and offering consultation. See attachment B for a sample letter.

A client may be uncomfortable in disclosing their substance use problem to their physician in the early stages of treatment. If they express this concern, do not argue or

attempt to convince them to sign the letter or consent. Instead, return to the subject at a later date using Motivational Interviewing techniques to help them determine the benefit of involving their physician in their support system. A brief guideline to Motivational Interviewing and a list of resources to learn about this treatment approach may be found under “clinical guidelines” on the BHRM web site at www.bhrm.org.

Addressing lack of a primary care relationship

Commonly, people entering addiction treatment lack any ongoing primary care relationships. In this case, the addiction treatment provider must assist individuals in selecting and establishing a relationship with a provider or clinic. This may be a difficult task for persons who are covered by Medicaid or are uninsured as many primary care providers shy away from accepting these populations into their practice.

A potential solution for many locations is to partner with a Federally Qualified Health Center (FQHC). These organizations are funded by the Bureau of Primary Health Care, a branch of the US Department of Health and Human Services’ Health Resources and Services Administration. The centers originated in the 1960’s as a component of the War on Poverty as neighborhood health centers. They are now funded under section 330 of the Health Centers Consolidation Act of 1996 and are a key component of the Bush Administration’s efforts to expand health care for persons who are uninsured.

FQHCs are located in both urban and rural medically underserved areas to provide preventive and primary health care and dental care. A key fact is that they are now required to provide mental health and substance abuse services. Over 3,000 clinics are operated by FQHCs across the United States and territories.

Under the 330 program, a successful applicant receives an initial Federal grant of up to \$650,000 annually. A key component of the program is the enhanced Medicaid and Medicare rates paid to FQHCs. These rates often exceed \$100 per encounter. The enhanced Medicaid and Medicare rates allow organizations to expand services to the low income uninsured. Thus, the success of a FQHC depends on being able to enroll the right balance of patients. Many women in addiction treatment and even a larger percentage of their children are covered by Medicaid thus they are an attractive population for a FQHC. There are also FQHC “look alike” clinics that receive the enhanced Medicare and Medicaid rates but do not receive the Federal grant.

Establishing a partnership with a local FQHC will usually be beneficial to both parties. The addiction treatment provider will have a resource for linking their clients to needed primary health care. The health clinic may be able to meet their requirements to provide substance abuse treatment through a relationship with the addiction treatment provider.

There are numerous Federally Qualified Health Centers operating clinics in Illinois.

The name and addresses of these clinics are contained in Attachment C .

Linkage to a primary care physician may occur at any point in the treatment process but should be completed prior to treatment completion. If the person has identified health care needs, the referral should be made early in the treatment process to begin the address of these problems.

It is important that the client be assisted to enroll with a primary health care provider even if they do not wish to disclose their substance use disorder and treatment at the present time. As the relationship with the physician is established, they may become comfortable in disclosure at a later date. Thus, if they choose to not disclose, the counselor or medical staff at the addiction treatment center should assist the individual in making a call to set an appointment with the primary care clinic.

If the client is willing to disclose, the program may contact the clinic and assist in the enrollment process. The primary care clinic will usually request certain records from the addiction treatment provider including the history and physical completed by the program's attending physician and recommendations for continuing care. Consents for release of this information is necessary and the letters contained in Attachments A and B can be sent to the primary care physician.

If the client refuses to allow referral to a primary care physician, Motivational Interviewing techniques can be utilized to assist the person in weighing the potential benefits on their long term health status.

Next steps

Linkage between addiction services and primary care is a first step toward an integrated treatment model. True integration would involve a team approach that provides a "one stop" care system that combines primary care, addiction and mental health treatment through either a single provider or a through utilizing a collaboration. Models of this approach are emerging particularly in staff model HMOs. The acid test of a truly integrated model is the existence of a single clinical record for all problem areas.

Attachment A

Dear Dr. _____,

Over the past few years, I have experienced a growing problem in my relationship with alcohol and or other drugs. This communication is to inform you that I am now seeking help for these problems at White Oaks in Peoria, IL. The staff of White Oaks encouraged me to enlist your support in my long-term recovery from these problems. I have signed a release of information giving Dr. _____ and the other staff permission to talk with you about the services I received and my continued recovery plan.

I am learning that my recovery requires long-term management. You can be a significant help to me. I am designing my plan for recovery with that in mind. I will be contacting your office in the near future to schedule an appointment with you to review the status of my physical health and to seek your suggestions regarding my continued recovery. Your support at this important transition time in my life is greatly appreciated.

Enclosed is a copy of the release I signed that will allow the staff at White Oaks discuss my condition with you.

Sincerely,

Attachment B

Dear Dr. _____,

Your patient, _____, has been admitted to White Oaks outpatient for treatment of a substance use disorder and has requested that I contact you to solicit your support in his/her continued recovery. I have encouraged _____ to schedule an appointment with you as soon as possible to discuss with you any continuing health concerns.

Your participation in the recovery process from addiction will be very important. Recovery is a long term process that requires ongoing monitoring and support. Research has shown that primary care physicians can be a key component of assisting persons with substance abuse disorders. A manuscript published in the Journal of the American Medical Association, *Brief Physician Advice for Problem Drinkers* by Fleming et. al. (JAMA 277 (13): 1039-1045, 1997) shows that very brief interventions by primary care physicians can exert a profound effect on the patient who abuse alcohol. Many subsequent studies have found similar results. To support your work with such patients, we have enclosed a brief exhibit that details the important role the physician can play in recovery from addiction-related disorders. Monitoring _____'s recovery status, encouraging and supporting the importance of this recovery process, and, if necessary, early re-intervening in any alcohol-or other drug-related relapses will go a long way in supporting his or her continued recovery.

From our experience providing addiction treatment services in the Peoria area for more than 20 years, we know that many people in recovery have medical issues that require the support of a primary care physician knowledgeable in addiction and addiction recovery. Our patients have greatly benefited from such support over the years. Our agency is available at any time to assist you. If you have any concerns regarding this or another patient and how together we may better serve them, please contact either myself or _____, RN at _____.

Enclosed is a copy of the release your patient signed authorizing our continued communication.

Sincerely,

MD
